INTRODUCTION

This report summarizes data compiled from original birth, death, stillbirth and induced abortion, marriage and divorce records filed with the Office of Vital Records as required by law. Standard forms recommended by the National Center for Health Statistics are used for all records, with the exception of marriage and divorce.

Responsibility for the filing of the **birth certificate** lies with the hospital medical records or nursing personnel, the physician, midwife, or other attendant. Funeral Directors, or persons acting as such, are legally charged with filing **death certificates** and **fetal death certificates**. County Recorders are responsible for forwarding the original **marriage certificates** or computerized tapes containing marriage data to the Office of Vital Records for maintenance of a data file. The County Clerk of each county is required to submit a **report of decree of divorce/annulment** to the Office of Vital Records within a month of the occurrence. **Induced abortion reports** are completed and sent in directly to the Office of Vital Records by the physician, hospital or clinic. The quality of data presented in the report is directly related to the completeness and accuracy of the information contained on the certificates.

Users of this publication are welcome to offer their comments and/or suggestions concerning format, content, technical aspects of the publication, or requests for additional data by submitting them to:

Office of Vital Records
Bureau of Health Planning and Statistics
Nevada State Health Division
505 E. King St., Room 102
Carson City, Nevada 89701-4749
(775) 684-4242

THE NEVADA REGISTRATION SYSTEM

The Nevada Office of Vital Records has three distinct components:

- The Vital Records Section where public requests for certified copies and amendments of said copies are processed.
- The Quality Control/Data Entry Section where the records are checked for completeness and accuracy and then entered into a database onto the State Mainframe Computer System.
- The Statistical Section that analyzes and publishes reports based on statistics from the database and provides technical assistance to users of the data.

The vital events of deaths, marriages and divorces are first recorded at the county level before being forwarded to the State Registrar. Births in all counties are recorded electronically, directly with the State Registrar, except in Clark and Washoe Counties, where they are initially processed and then transmitted to the State Registrar. Abortions are reported directly to the Office of Vital Records for encoding and entering into the State's database. All records are checked for completeness and accuracy, and then given a state file number before encoding and entering into the State's database. Birth and death records are kept on permanent file for certification use and amendment when necessary by the public and various government agencies. Marriage, divorce, and abortion records are not maintained after entry into the State's database.

DEFINITIONS

- ABORTION:*** The termination of a human pregnancy with an intention other than to produce a live birth or to remove a dead fetus.
- DEATH:*** A person who has sustained irreversible cessation of all functioning of the brain, including the brain stem, is considered dead.
- DIVORCE:*** Termination of a marriage.
- FETAL DEATH:*** A birth that occurs after at least 20 weeks gestation in which the child shows no evidence of life after complete birth.
- INFANT DEATH:*** Deaths occurring to individuals of less than one year of age.
- LIVE BIRTH:*** A birth in which the child shows evidence of life after complete birth. A birth is complete when the child is entirely outside the mother, even if the cord is uncut and the placenta is still attached. Evidence of life includes heart action, breathing, or coordinated movement of voluntary muscles.
- LOW BIRTHWEIGHT:*** A birth wherein the birth weight is less than 2,500 grams (5 ½ pounds).
- MARRIAGE:*** A formal mutual relation of husband and wife that is filed with the County Recorder in the county where the license was issued.
- NEONATAL DEATH:*** Death occurring to infants in the first 27 days of life.

OCCURRENCE

(COUNTY OF):

Data allocated by the location of where the event actually occurred.

PERINATAL DEATH:

Death occurring to a fetus of 20 weeks gestation or more, including infant deaths occurring within 27 days of life.

PRENATAL CARE:

The care received by the mother from a health professional or midwife during the length of the pregnancy.

RESIDENCE

(COUNTY OF):

The usual residence of the individual. For deaths, this is defined as the usual residence of decedent as indicated on the certificate. For births and fetal deaths, the residence is defined as the usual place of residence of the mother.

UNDERLYING CAUSE

OF DEATH:

The disease or condition which gave rise to the chain of morbid events leading to death, including the circumstances of an accident or violent event that produced a fatal injury.

S.I.D.S.:

Death due to Sudden Infant Death Syndrome.

FORMULAS FOR RATES

<i>Abortion Rate</i>	=	$\frac{\text{Number of Abortions X 1,000}}{\text{Total Live Births}}$
<i>Cause-Specific Rate</i>	=	$\frac{\text{Number of Deaths from a Specific Cause X 1,000 or 100,000}}{\text{Population}}$
<i>Crude Birth Rate</i>	=	$\frac{\text{Number of Births X 1,000}}{\text{Population}}$
<i>Crude Death Rate</i>	=	$\frac{\text{Number of Deaths X 1,000 or 100,000}}{\text{Population}}$
<i>Divorce Rate</i>	=	$\frac{\text{Number of Divorces and Annulments X 1,000}}{\text{Population}}$
<i>Fertility Rate</i>	=	$\frac{\text{Number of Live Births X 1,000}}{\text{Female Population (15-44)}}$
<i>Fetal Mortality Rate</i>	=	$\frac{\text{Number of Fetal Deaths X 1,000}}{\text{Total Number of Live Births and Fetal Deaths}}$
<i>Infant Mortality Rate</i>	=	$\frac{\text{Number of Infant Deaths X 1,000}}{\text{Total Number of Live Births}}$
<i>Low Birth weight Rate</i>	=	$\frac{\text{Number of Low Birth weight Births X 1,000}}{\text{Total Number of Live Births}}$
<i>Marriage Rate</i>	=	$\text{Number of Marriages X 1,000}$

Population

Neonatal Mortality Rate = $\frac{\text{Number of Neonatal Deaths X 1,000}}{\text{Total Number of Live Births}}$

Perinatal Mortality Rate = $\frac{\text{Number of Perinatal Deaths X 1,000}}{\text{Total Number of Live Birth and Fetal Deaths}}$

Post-Neonatal Mortality = $\frac{\text{Number of Infant Deaths and Neonatal Deaths X 1,000}}{\text{Total Number of Live Births}}$

TECHNICAL NOTES

RACE AND ETHNICITY: Hispanics are an ethnic group, not a race, and may include all races within their ethnic classification. In this report, Asian-Pacific Islander, Black, Native-American, and White exclude Hispanics; therefore, no duplicate counting exists.

POPULATION DATA: The Nevada population data is based on the database established by the Nevada State Demographer's Office and the Nevada Department of Taxation.

COUNTY COMPARISONS: The population size of the counties in Nevada is widely varied, from one thousand to over one million. Because of these differences, caution should be used when interpreting the rate comparisons for counties.

REGIONAL COMPARISONS: Eighty five percent (85%) of Nevada's population resides in the urban areas of Clark (Las Vegas) and Washoe (Reno) Counties. In this report, data is stratified into three regions within the State as follows: Clark County, Washoe County, and All Other Counties (all remaining 15 counties).

METHODS FOR AGE ADJUSTMENT AND STATISTICAL ANALYSIS OF MORTALITY RATES: In order to make meaningful comparisons between mortality rates for the residents from different regions, or from different race/ethnic groups, differences in the age characteristics of the populations should be taken into account. For example, one would expect that the mortality rate for heart disease would be high in a population that has a high proportion of older individuals. Age-adjustment is the application of the age-specific rates in a population of interest to a standardized age distribution in order to eliminate the differences in observed rates that result from age differences in populations compared. This adjustment is usually done when comparing two or more populations at one point in time or one population at two or more points in time.

In this report, the death rates are age-adjusted to the US standard million population (relative age distribution of 1940 enumerated population of the United States totaling 1,000,000). This method produces the rate that would be expected if the population of interest had the same population age distribution as the standard population.

Adjusted rates were calculated in the following manner:

- The expected number of deaths in each age group was determined by multiplying the age-specific rates (N_i/P_i) by the corresponding age-specific standard population total (S_i).
- Age adjusted rates (AAR) per 100,000 population were calculated by dividing the expected total number of deaths (E_i) by the total standard population and multiplying by 100,000.

It should be noted, that the 1998 data used in this report will be the last year in which age-adjusted rates to the US standard million population relative age distribution of the 1940 enumerated population of the United States has been utilized. Beginning with the 1999 data, the National Center for Health Statistics will require rates that are age-adjusted be adjusted to the US standard million population relative age distribution of the 2000 enumerated population of the United States.

From 1990 to 1998, Nevada was by far the fastest growing state in the nation and Las Vegas was the fastest growing metropolitan area in both Nevada and the nation. The 1990 Nevada population of 1,201,000 grew by over 56% to 1,874,000 in 1998 and is projected to surpass two million by 2000 (Year 2000 Nevada population: 2,034,010). The vast majority of growth has been by in-migration. The Las Vegas and Reno metropolitan areas contain more than four out of every five (84%) of the state's residents.

The age mix of Nevada's population varies from the nation as a whole by having a higher share of people in the age groups between 25 and 45 and a lower share of elderly persons. In 1998, about 76% of Nevada's population was White-Non Hispanic. Black-Non Hispanic, Native American-Non Hispanic, Asian-Non Hispanic, and Hispanic consist of 6.8%, 1.5%, 3.0%, and 12.8% respectively. The fastest growing ethnic group in the state is Hispanic origin, which increased over 50% since 1990.

1998	1,874,760	947,726	927,034	1,422,838	127,669	27,830	55,555	240,868	318,050	1,265,590	291,120

Nevada experienced an increasing birth rate from 1985 to 1990 followed by a moderate decrease in the rate through 1998 with a slight increase from 1996 to 1997. There were a total of 28,647 live births in Nevada in 1998, among them 28,275 births with the mother's residency of Nevada. The crude birth rate for Nevada residents was 15.1 per 1,000 population, while the Hispanic ethnic group had a crude birth rate of 36.2 per 1,000 population.

TOTAL	26,384	115	1,380	508	190	70	28,647

The rate of prenatal care in the first trimester increased from 71.6% in 1992 to 79.0% in 1996 followed by a decrease in rates in 1997 (77.8%) and 1998 (76.7%). In 1998, among the racial/ethnic groups, Whites had the highest prenatal care rate at 83.7%, followed by Asians 78.6%, Native Americans 72.6%, Blacks 69.4% and Hispanics 65.3%.

The incidence of low birthweight babies in Nevada was 7.6% in 1998, no change from the previous year. Although Blacks improved the rate from 14.1% in 1997 to 13.5% in 1998, they still had the highest low birthweight rate among all racial/ethnic groups.

Teen pregnancy rates in Nevada continued the trend of decreasing during the past seven years for all three teen age groups. In 1992, the pregnancy rates for ages 10-14, 15-17 and 18-19 were 2.7, 62.4 and 158.9 per 1,000 population respectively, while in 1998, the rates decreased to 1.7, 48.7 and 129.8 per 1,000 respectively.

In 1998, Nevada's infant mortality rate was 6.9 per 1,000 live births. Although it was below the national year 2000 objectives of 7.0 per 1,000, the rate reversed the trend of decreasing since 1992 and became the highest year in Nevada during the past seven years. Washoe County (from 6.0 to 9.2) as a region, and Blacks (from 13.6 to 17.0) as a race/ethnicity group contributed heavily to this increase in rate. Among the race/ethnicity groups, Blacks had the highest infant mortality rate at 17.0, followed by Native American at 15.5, while Asians had the lowest rate at 5.1 per 1,000 live births.

Diseases of the heart and malignant neoplasms (i.e. cancers) ranked one and two respectively for the leading causes of death in Nevada. In 1998 these two diseases were responsible for 7,493 deaths in Nevada, accounting for 52.8% of total deaths in the State. However, these two causes accounted for slightly lower death rates in Nevada than nationally, when age-adjusted comparisons were made.

After age-adjustment, race/ethnicity group comparisons indicate that Blacks had the highest death rates for both diseases of the heart and malignant neoplasms.

In 1998, Nevada's crude suicide death rate was almost twice the national average (age-adjusted rate: 19.4/100,000 (NV98) vs 10.4/100,000 (US 97)). Nevada has continually ranked highest in the nation during the past 10 years. Regional, race/ethnicity, and age analysis showed the highest suicide death rates were among rural counties, Whites, and the age group 35-44 year olds.

Nevada was slightly higher than the US average for death rates of motor vehicle crashes in 1998. The highest groups were rural counties, Hispanics, and two age groups: age older than 85 and 15-24 year olds.
